

# **N3RoXDorksTutorial**

**Alright so we will start our dorks in depth tutorial**

**So many of you guys have used dorks generators to get dorks but you were probably getting same URLS again & again or weren't getting any good databases.**

**For the start we will learn**

What is a DORK?

It is a combination of keyword with page type & page format.

**Ok so I will first tell you some basic type of dorks with their layout you can manipulate them, and use custom keywords and domains to find unique websites over the internet.**

**#1**

**inurl:index.php?id= +.com**

## **Explanation:**

**So basically what this dork will do is search for index.php?id in the URL's which have .com domain where .com is changeable into any other domain like .org .net and so on...**

**& you can change index into any of your desired keywords and you can also change .php into other page formats like .asp .cgi ETC**

## **#2**

**inurl:index.php?id= intext"keyword"**

## **Explanation:**

**Where "keyword" can be any word that you want, and this dork will find index.php?id in the url and your specific "keyword" intext you can change .php into other page formats like .asp .cgi ETC**

### **#3**

**intext:"keyword" +site:Any Country**

#### **Explanation:**

**where "Keyword" can be any word you want and "Any Country" can be us,uk,il ETC This dork will search for your specific keyword in the text of url in only your specific country selected.**

Similarly i will list some of the codes

intitle:

intext:

define:

site:

info:

link:

**you can add your desired country + your keyword after the : and use them for desired results.**

**#4**

**inurl:Country/Keyword or**

**inurl: "keyword" + "keyword" = site: .com**

**Explanation:**

**This will search for URL's that match your "Country" and your specific "Keyword" and display matching results.**

**#5**

**Keywords**

**Explanation:**

**Keywords play a key role of what you are looking for it can be any keyword related to gaming or programming literally anything you can think of.**

**#6**

## **Page Formats**

### **Explanation:**

**Like I haven't seen any that are beyond the ones i will be listing Page formats are miss & and a go i would recommend you guys to only go with some basic ones like .asp? or .php? or .cgi? but yea afterwards you can try all of them that I mentioned below.**

.php?

.php3?

.php4?

phpx?

cat/?

.phtml?

events?

products/?

site/?

.cfm?

contact-us?

blog/?

aspx?

.cfm

.asp?

.cgi?

.aspx?

.flv?

.pdf?

.jsf?

.ashx?

.raw?

.File?

.tss?

.blog?

.html?

.flv?

.pdf?

.jsf?

.jsp?

.psml?

.raw?

.File?

.tss?

.blog?

.htm?

## **#7**

### **Page Types**

#### **Explanation:**

**Now there are many page types there are many possibilities I will try to list all I can for you guys so it will be click work for you guys to make manual dorks.**

jobid=

item\_id=

id=

topic=

NewsId=

langid=

article\_id=

cid=

code\_no=

code=

designer=

framecode=

idproduct=

intCatalogID=

intProdId=

item=

itemID=

maingroup=

misc=

order\_id=

p=

pid=

ProdID=

product\_id=

product=

productid=

showtopic=

Sku=

storeid=

style\_id=

StyleID=

userID=

cartId=

bookid=

idCategory=

PageID

catid=

Store\_Id=

card=

action=

cart\_id=

iCat=

CatalogID=

UserID=

BookID=

Product\_ID=

Service\_ID=

itemid=

title=

eid=

model=

prodtype=

shopcd=

item\_ID=

Cart=

PartID=

ViewType=

keyword=

Item=

search\_id=

Cat=

Action=

command=

&game\_type=

&GameID=

group\_id=

group=

groupCode=  
GameID=  
GameKey=  
GameName=  
gameNo=  
gamerblogid=  
gamereferral=  
gamesearch=  
gameType=  
game\_id=  
GAME\_ID=  
game\_link=  
game\_name=  
GP=  
gpu=  
gr\_name=  
gr=  
grade=

Alright so now you will manually select different page type like I select game\_name= now there will definitely go a keyword related to gaming cause this page type is specific for 'gaming'

We can take another example of Product\_ID= what comes up in your mind after you saw this page type? it is something related to shopping exactly so only shopping based keywords will go with it.

Example

1                      2              3

"Keyword" '.asp?' item=

Where in 1st position your desired keyword will go in the 2nd your desired page format will go and in 3rd your page type will go & this is how you make dorks.

After reading this you will have enough knowledge and i can guarantee you if you read this properly once you apply it you will definitely get great results.

You can use dork generator to speed up your work a little bit but I won't recommend using them at the very first stage you should first play with #1,#2,#3,#4 steps after you are done with them there is nothing left everything will become easy for you.

Glad you bought this e book
